Figure 1 the circuit diagram. After that we connect the A and B point to the telephone lines. In normal state that not have the incoming call, the DC voltage +48 volts will cannot through to the capacitors-C1, so no current flow to D1-D4. Thus, no bias current to the base lead of the transistor-Q1 , so it doesn't conduct current . While,the voltage at the collector of Q1 will rises, cause ...

Here is a simple blinking LED circuit which will alert users when the line is in use before the receiver is lifted. The circuit loads the phone line so lightly that it meets the on-hook telephone equipment leakage specification and the short lamp flashes draw very little current from the nine-volt battery. One of these devices may be placed at each extension without significantly loading the phone line. The circuit is connected to the red and green wires for a single-line system or the ...

The connections arrangements are shown in the circuit diagram shown above. The +9V power supply or battery is used. In this circuit, we have used all the transistors as a switch. The water touches the wires' contact with base of each transistor, a small current flows through the base and turns on the transistor as the transistor turns on, the LED connected to it glows.
